Bees Their Vision Chemical Senses And Language
Bees Their Vision Chemical Senses
Light senses. Vision is used by animals to determine the layout of their surroundings, and thus this sense is particularly important for locomotion. In animals with eyes that have good resolution, vision can be used to identify objects from their geometric appearance; however, this requires a sophisticated brain of the kind found in vertebrates, cephalopod mollusks such as octopus, and higher...

The Austrian zoologist Karl von Frisch began the exploration of color vision in honey bees when, in 1919, he asked whether or not bees have color vision. He performed an elegant experiment that showed not only that the bees could discriminate colors but that they demonstrated associative learning. He first trained his bees to feed from a small dish filled with a nectar-like sugar water.

A sense is a physiological capacity of organisms that provides data for perception. The senses and their operation, classification, and theory are overlapping topics studied by a variety of fields, most notably neuroscience, cognitive psychology (or cognitive science), and philosophy of perception. The nervous system has a specific sensory nervous system, and a sense organ, or sensor, dedicated...

Chemoreception - Chemical defense: The best-known example of a vertebrate that uses odour for defense is the North American skunk. When threatened, skunks perform a visual warning. However, if this fails to deter a potential attacker, they produce an odorous spray from anal glands that are located on each side of the anus. The secretion contains several major and minor components that vary...

Today I found out humans have a lot more than five senses. It turns out, there are at least nine senses and most researchers think there are more like twenty-one or so. Just for reference, the commonly held definition of a “sense” is “any system that consists of a group of sensory cell types that respond to a specific physical phenomenon and that corresponds to a particular group of...

But, all of this doesn't compare with the Dodder plant. Dodder not only uses taste, smell, movement and touch to manipulate other plants, but is, also, able to hijack all of their genes. The remarkable Dodder plant might be the most intelligent plant.

Is the Dodder the Most Intelligent Plant - Jon Lief, M.D.
2. THE WORKING OF THE SEX IMPULSE. Man wishes to have children to maintain the race or line. This is the reproductive instinct. The desire to copulate proceeds from this sexual instinct.

Our sense of smell is ancient in its evolution and powerful in its emotion. Are there good smells and bad smells? A Brown University psychology professor who became enchanted with the smell of skunk as a little girl mounts a compelling argument that nothing smells great, and nothing stinks, but experience makes it so. Is that root beer or stinky lineament?

Roughly 8 million years ago, some apes stood up and started human evolution. Okay, that’s not really what happened. But it is a fair characterization of the way scientists identify the oldest fossils likely to be human ancestors.

In 1655, Christiaan Huygens discovered 'Titan,' Saturn's largest moon, and that what Galileo had thought were moons were actually rings. He was the first to note markings on Mars. He also applied Galileo's idea that a falling body does so in a straight line to planetary orbits, calculating "the radial force necessary to keep a planet in a circular path [is] mv ² /r, where m is the mass, v the ...
