ISO 2372 (10816) Standards provide guidance for evaluating vibration severity in machines operating in the 10 to 200Hz (600 to 12,000 RPM) frequency range. Examples of these types of machines are small, direct-coupled, electric motors and pumps, production motors, medium motors, generators, steam and gas turbines, turbo-compressors, turbo-pumps and fans.

Vibration Monitoring Non Rotating Machines. VM - Vibration Monitoring (ISO 10816) - is it evidently shaking itself - monitor by operator or transducer. Vibration Monitoring has its roots in maintenance engineers inspecting machines during their traditional walk around. It attempts for formalise an instinctive understanding that a machine is ...

ISO 10816-1 replaces ISO 2372 as a general guide outlining measurement and evaluation of mechanical vibration in typical industrial machinery. Note that although these guidelines are defined in accordance to machine classification as noted below, these guides provide a standardized starting point for evaluation. Once the general classification ...

The criteria of this part of ISO 10816 apply to in situ broad-band vibration measurements taken on the bearings, bearing pedestals, or housing of machines under steady-state operating conditions within the nominal operating speed range. They relate to both acceptance testing and operational

monitoring.

ISO 10816-21:2015 specifies the measurement and evaluation of mechanical vibration of wind turbines and their components by taking measurements on non-rotating parts. It applies to horizontal axis wind turbines with mechanical gearbox and rated generator output exceeding 200 kW and the following design and operational characteristics:

ISO 10816-1 General Machines. ISO 10816-1 is a basic document which sets out general guidelines for the measurement and evaluation of mechanical vibration of machines, as measured on non-rotating parts.

**ISO10816 Charts | Vibsens**

This part of ISO 10816 gives criteria for assessing vibration levels when measurements are made in situ. The criteria specified apply to machine sets having a power above 15 kW and operating speeds between 120 r/min and 15 000 r/min.

ISO 10816-1:1995(e) 0 ISO 10816-1 is for monitoring purposes. However, in some cases machine is satisfactory when measured under certain conditions. The use of vector information for Vibration assessment steady-state conditions, it can become unsatisfactory on certain machine types may be desirable.

For flexibly coupled motors, this part of ISO 10816 is applicable for the pump only. Also, separately mounted drivers are not within the scope of this part of ISO 10816. Those drivers are dealt with in ISO 10816-3. The following types of pumps are excluded from this part of ISO 10816: — reciprocating and rotating positive displacement pumps;

This second edition cancels and replaces the first edition (ISO 10816-3:1998). The main change is the deletion of pumps from the scope, which now are dealt with in ISO 10816-7. ISO 10816 consists of the following parts, under the general title Mechanical vibration — Evaluation of machine vibration by measurements on non-rotating parts:

Thanks for your response, I have a table for vibration evaluation standard for reciprocating machine (ISO 10816-6). In the table, there are 7 machine classes. But there is no explanation about what differs of each class (whether they differ because of their power, rpm, support etc.) Please help me to find the base of the classification plz.
